RESEARCH PAPERS

[1] **Housing Is the Financial Cycle: Evidence from 100 Years of Local Building Permits**
(*joint with Gustavo Cortes*)

Best Paper Award at 2025 AREUEA National Conference

Does the housing market lead the financial cycle, and if so, why? We address these questions by creating a new hand-collected database spanning a century of monthly building permit quantities and valuations for all U.S. states and the 60 largest MSAs. We show that the option to build embedded in permits renders volatility in residential building permit growth (BPG) a strong predictor of aggregate and cross-sectional stock and corporate bond returns and return volatility. This predictability remains even after conditioning on corporate and household leverage, commodity price risk, and firms' exposure through their network of plants to other localized physical risks like natural disasters. Cities and states with more elastic housing supply consistently predict financial market downturns at 12-month horizons, resulting in new trading strategies to hedge against overbuilding risk. A noisy rational expectations framework in which local building permits serve as a quasi-public signal for dividends explains these empirical patterns.

[2] **Pricing Government Contract Risk Premia: Evidence from the 2025 Federal Lease Terminations**
(*joint with Soon Hyeok [Steve] Choi*)

Are government contracts a safe investment? We investigate this question using unanticipated Department of Government Efficiency (DOGE) cancellations of federal leases as a shock to commercial mortgage default risk. Offices with DOGE-notified leases experience persistent net operating income declines exceeding

15%, with large, negative effects on CMBS prices and rental cash flows tied to nearby private-tenant properties in Washington, D.C. Spillovers are driven by increased vacancy from tenants with high exposure to procurement contracts involving disrupted federal agencies. Simulations of office property value losses from early lease terminations indicate substantial market-wide repricing of government contract risk.

[3] Picking Up the PACE: Loans for Residential Climate-Proofing

(joint with Aymeric Bellon, Francesco Mazzola, & Guosong Xu)

2025 E-Axes Forum Research Prize (Honorable Mention)

Residential Property Assessed Clean Energy (PACE) is an innovative financing program that allows homeowners to borrow for energy efficiency or resilience upgrades and repay the loans through their property tax bills. We collect new Florida PACE loan-level data and recover households' home improvement investment decisions from permit descriptions. PACE projects are capitalized into home values, but expansions of the property tax base are partially offset by an uptick in borrowers' tax delinquency rates. Lenders in PACE-enabled counties expand mortgage credit access, indicating improved recovery values despite a PACE lien's super seniority. Overall, PACE adoption increases local fiscal income while improving climate-proofing of the housing stock and lowering homeowners' insurance costs.

[4] Interest Rate Caps, Corporate Lending, and Bank Market Power: Evidence from Bangladesh

(joint with Yusuke Kuroishi & Yuhei Miyauchi)

How does market power in the corporate banking sector influence the effects of interest rate cap policies on credit allocation? We study this question using credit registry data in Bangladesh, where the Central Bank capped rates on corporate loans in 2009. Using difference-in-differences designs with variation in pre-regulation, branch-level rates as exposure measures, we find that a one percentage point cap-induced drop in rates increased lending amounts by 36%. This increase in lending is not driven by costs of supplying credit. Our results point to substantial credit under-provision due to banks' market power, even in the presence of relationship lending.
